

Week 12-1:

--Practice Session- Coding

ROLL NO.:240801175

Name: Levin Prince L

Status	Finished
Started	Friday, 27 December 2024, 12:36 AM
Completed	Friday, 27 December 2024, 12:38 AM
Duration	1 min 30 secs

Q1) A binary number is a combination of 1s and 0s. Its n th least significant digit is the n th digit

starting from the right starting with 1. Given a decimal number, convert it to binary and

determine the value of the the 4th least significant digit.

Example

number = 23

- Convert the decimal number 23 to binary number: $23_{10} = 2^4 + 2^2 + 2^1 + 2^0 = (10111)_2$.
- The value of the 4th index from the right in the binary representation is 0.

Function Description

Complete the function fourthBit in the editor below.

fourthBit has the following parameter(s):

int number: a decimal integer

Returns:

int: an integer 0 or 1 matching the 4th least significant digit in the binary representation of number.

Constraints

$0 \leq \text{number} < 231$

Input Format for Custom Testing

Input from stdin will be processed as follows and passed to the function.

The only line contains an integer, number.

Sample Input

STDIN Function

32 → number = 32

Sample Output

0

Explanation

- Convert the decimal number 32 to binary number: $32_{10} = (100000)_2$.
- The value of the 4th index from the right in the binary representation is 0.

Code:

```
1  /*  
2   * Complete the 'fourthBit' function below.  
3   *  
4   * The function is expected to return an INTEGER.  
5   * The function accepts INTEGER number as parameter.  
6   */  
7  
8  int fourthBit(int number)  
9  {  
10     int binary[32];  
11     int i=0;  
12     while(number>0)  
13     {  
14         binary[i]=number%2;  
15         number/=2;  
16         i++;  
17     }  
18     if(i>=4)  
19     {  
20         return binary[3];  
21     }  
22     else  
23         return 0;  
24 }
```

Output:

	Test	Expected	Got	
✓	printf("%d", fourthBit(32))	0	0	✓
✓	printf("%d", fourthBit(77))	1	1	✓

Passed all tests! ✓

Q2) Determine the factors of a number (i.e., all positive integer values that evenly divide into

a number) and then return the p th element of the list, sorted ascending. If there is no p th

element, return 0.

Example

$n = 20$

$p = 3$

The factors of 20 in ascending order are {1, 2, 4, 5, 10, 20}. Using 1-based indexing, if $p =$

3, then 4 is returned. If $p > 6$, 0 would be returned.

Function Description

Complete the function `pthFactor` in the editor below.

`pthFactor` has the following parameter(s):

`int n`: the integer whose factors are to be found

`int p`: the index of the factor to be returned

Returns:

`int`: the long integer value of the p th integer factor of n or, if there is no factor at that index, then 0 is returned

Constraints

$1 \leq n \leq 10^{15}$

$1 \leq p \leq 10^9$

Input Format for Custom Testing

Input from stdin will be processed as follows and passed to the function.

The first line contains an integer n, the number to factor.

The second line contains an integer p, the 1-based index of the factor to return.

Sample Input

STDIN Function

10 → n = 10

3 → p = 3

Sample Output

5

Explanation

Factoring n = 10 results in {1, 2, 5, 10}. Return the p = 3rd factor, 5, as the answer.

Code:

```
1  /*
2   * Complete the 'pthFactor' function below.
3   *
4   * The function is expected to return a LONG_INTEGER.
5   * The function accepts following parameters:
6   * 1. LONG_INTEGER n
7   * 2. LONG_INTEGER p
8   */
9
10 long pthFactor(long n, long p)
11 {
12     int count = 0;
13     for(long i=1; i<=n; ++i)
14     {
15         if(n%i==0)
16         {
17             count++;
18             if(count==p)
19             {
20                 return i;
21             }
22         }
23     }
24     return 0;
25 }
```

Output:

	Test	Expected	Got	
✓	<code>printf("%ld", pthFactor(10, 3))</code>	5	5	✓
✓	<code>printf("%ld", pthFactor(10, 5))</code>	0	0	✓
✓	<code>printf("%ld", pthFactor(1, 1))</code>	1	1	✓

Passed all tests! ✓
